

Less searching, more analyzing *Your clinical data deserves the best*

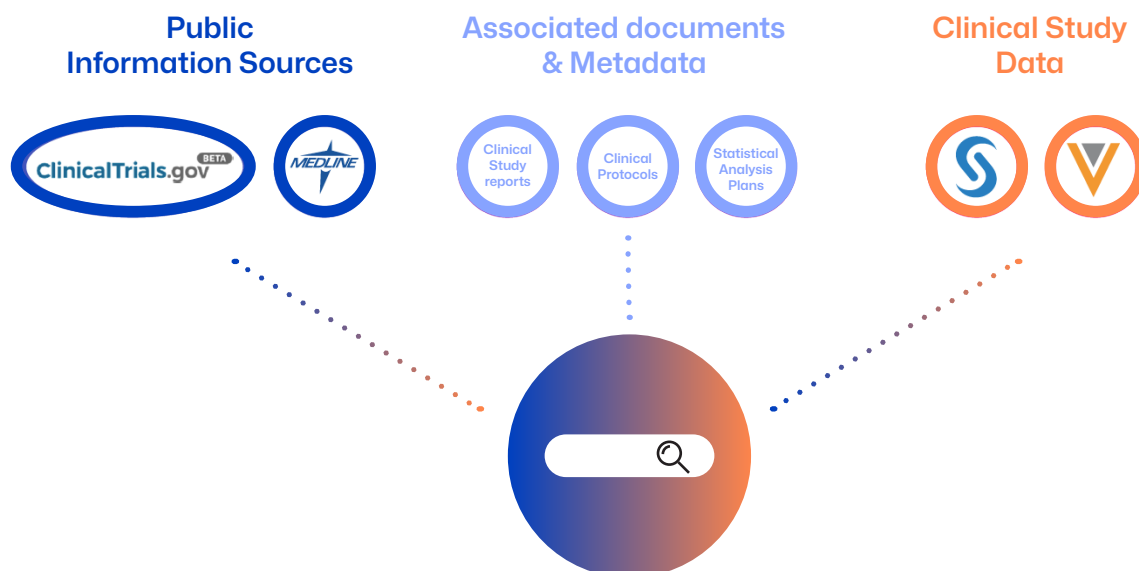

The creation, management, and analysis of randomized controlled trials can be difficult for even the most advanced pharmaceutical organizations. Clinical statisticians in particular face an incredibly challenging task every time they conduct a data study, search for a piece of information, or examine a variable relationship buried among a sea of SAS datasets. These requests often require them to start the search for very specific data in a very broad way... like being asked to “find a needle in a haystack,” with the added difficulty of having to find the right haystack first.

*Saving 5% (of 1,500 clinician's time) is an absolutely safe projection of value.
Just looking for something in Outlook would take more time [than using Sinequa].
But, clinicians with difficult workflows are actually saving 20% of their time.*

Oliver Thoennessen - Sr. Project Manager
Global IT, Drug Development

Sinequa for Clinical Data provides a single location for statisticians and clinical data managers to simultaneously search with pinpoint accuracy across SAS datasets, clinical protocols, public sources (like ClinicalTrials.gov or Medline), and much more for information to assist in trial design, variable control, or analysis of datapoints for statistical significance. By connecting directly to these data sources, Sinequa provides immediate access to relevant information and allows clinical professionals to easily find pertinent data for their study or analysis, or discover connections to studies they may not have known about previously.

In Clinical Data, knowledge you can't find isn't power... It's a problem

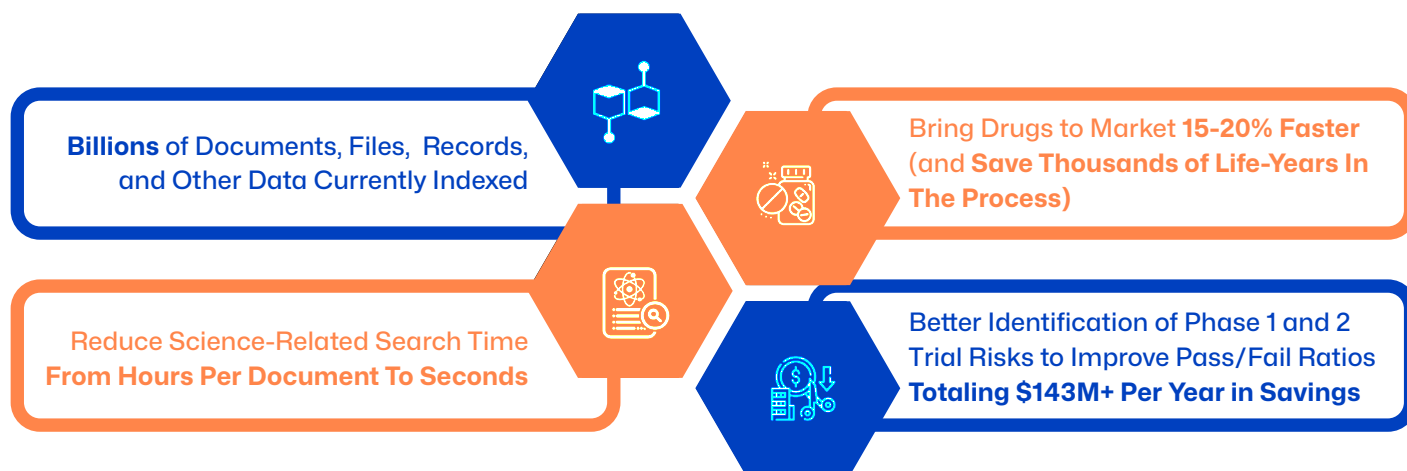

When your data is connected, finding clinical studies, trial plans, statistical metadata, or public information sources is **as simple as typing a question**.

Sinequa is simply great technology. We immediately saw its benefit watching it perform something we didn't know was possible. It makes an exponential difference for our organization.»
